

What efficacy and safety profiles can we expect

*Mathematical and Computational Biology in Drug Discovery
(MCBDD) Module IV*

*Dr. Jitao David Zhang
May 2025*

Where are we now

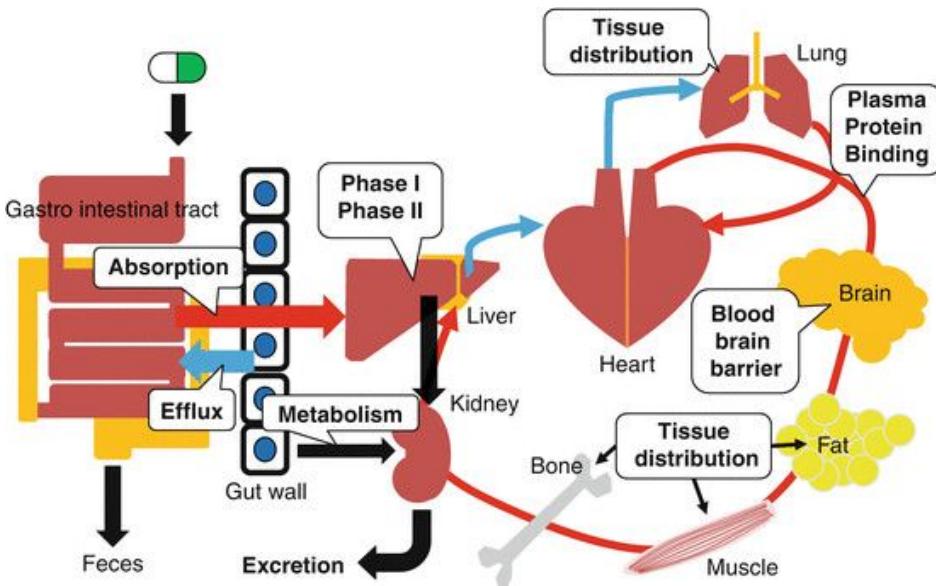

Target identification & assessment

Goal: we want to select **one compound** from a few (~ 10^2 - 10^0) for entry in human.

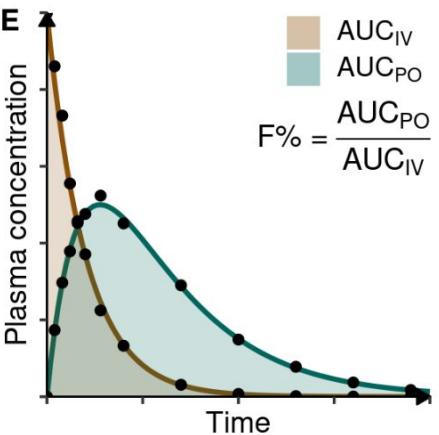

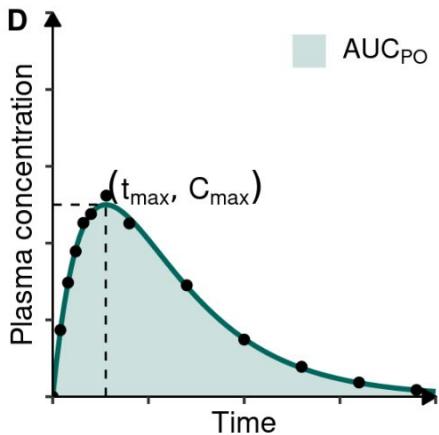

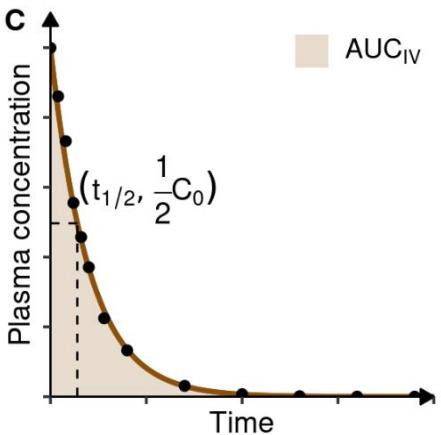

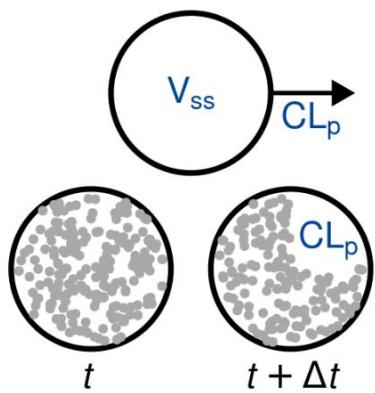

Key factors to consider in selecting compounds

- **Potency, efficacy and pharmacodynamics(PD)**
- **Pharmacokinetics (PK)**
 - Absorption
 - Distribution
 - Metabolism
 - Excretion
- **Toxicology**
- **Biomarkers**

Key PK parameters: V_{ss} , CL_p , $t_{1/2}$, t_{max} , C_{max} , and F

B

V_{ss}	Volume of distribution at steady state.	C_{max}	Maximum plasma concentration.
CL_p	Plasma clearance.	t_{max}	Time point in which the C_{max} is measured.
$t_{1/2}$	Half-life, time for a substance to reach the half concentration of the initial value (C_0).	F% (or F)	Bioavailability, the percentage of the administered compound reaching systemic circulation.

The Hill function as a typical PD model

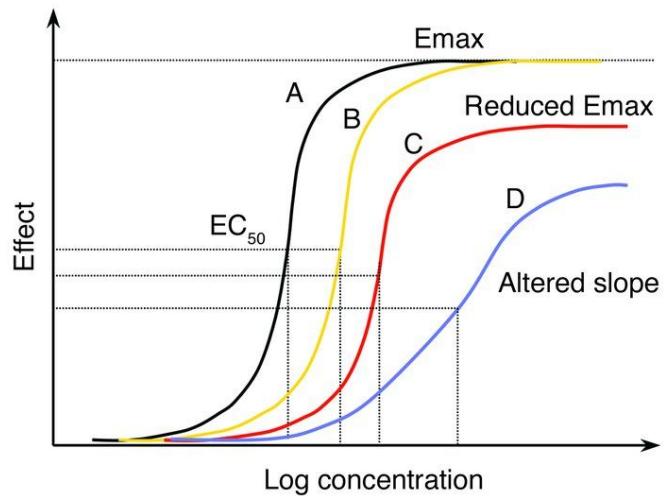

- The Hill function is one of the mostly useful non-linear functions to model biological systems.
- In its general form, H_{max} indicates the maximal value to which the function is asymptotic, n is the shape parameter (known as the Hill's coefficient), and k is the reflection point, often abbreviated as XC_{50} ($X=I, E, C, \dots$), the half-saturation constant.
- The Michaelis-Menten model is a special case of the Hill function with $n=1$.

$$H = H_{max} \frac{x^n}{k^n + x^n}$$

General form of the Hill function

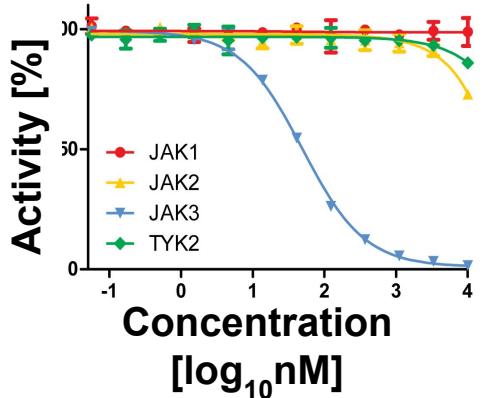

$$\begin{aligned} E &= E_{max} \frac{[L]^n}{EC_{50}^n + [L]^n} \\ &= E_{max} \frac{1}{1 + \left(\frac{EC_{50}}{[L]}\right)^n} \end{aligned}$$

Modelling dose-dependent effect

POLICY FORUM

BIOMEDICAL RESEARCH

Discovery research in physiologically maintained deceased

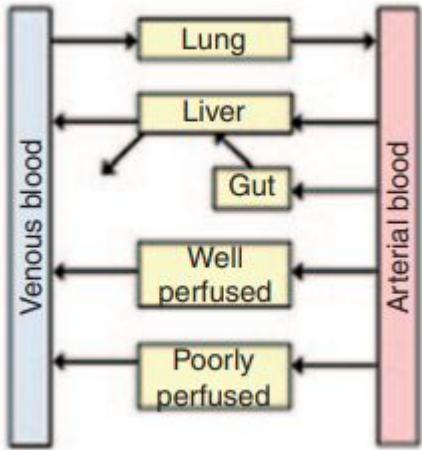

Expanded research opportunities in deceased humans require ongoing ethical inquiry

...this approach may...mitigate risks traditionally borne by human subjects during phase 1 clinical trials...

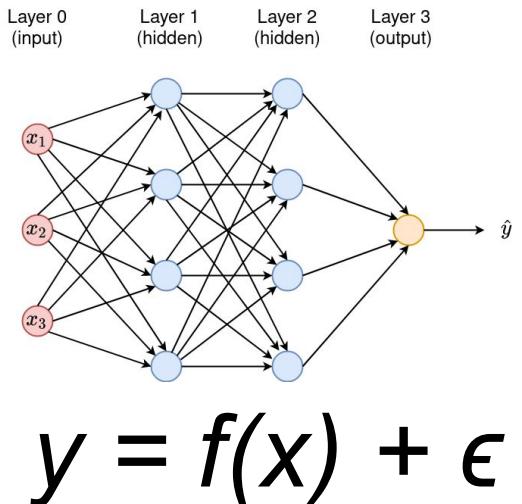

Douglas B. Pet^{1,2}, Brendan Parent³, Neel S. Singhal^{1,2}, Claire D. Clelland^{1,4}

Pet, Douglas B., Brendan Parent, Neel S. Singhal, and Claire D. Clelland. 2025. "Discovery Research in Physiologically Maintained Deceased." *Science* 388 (6746): 473–76. <https://doi.org/10.1126/science.adt3527>.

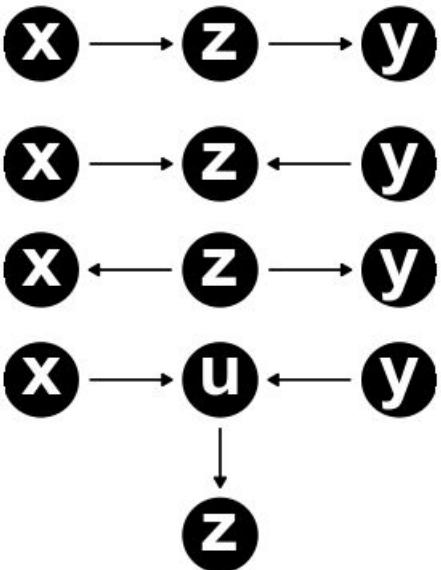

Three types of computational models

Mechanistic models

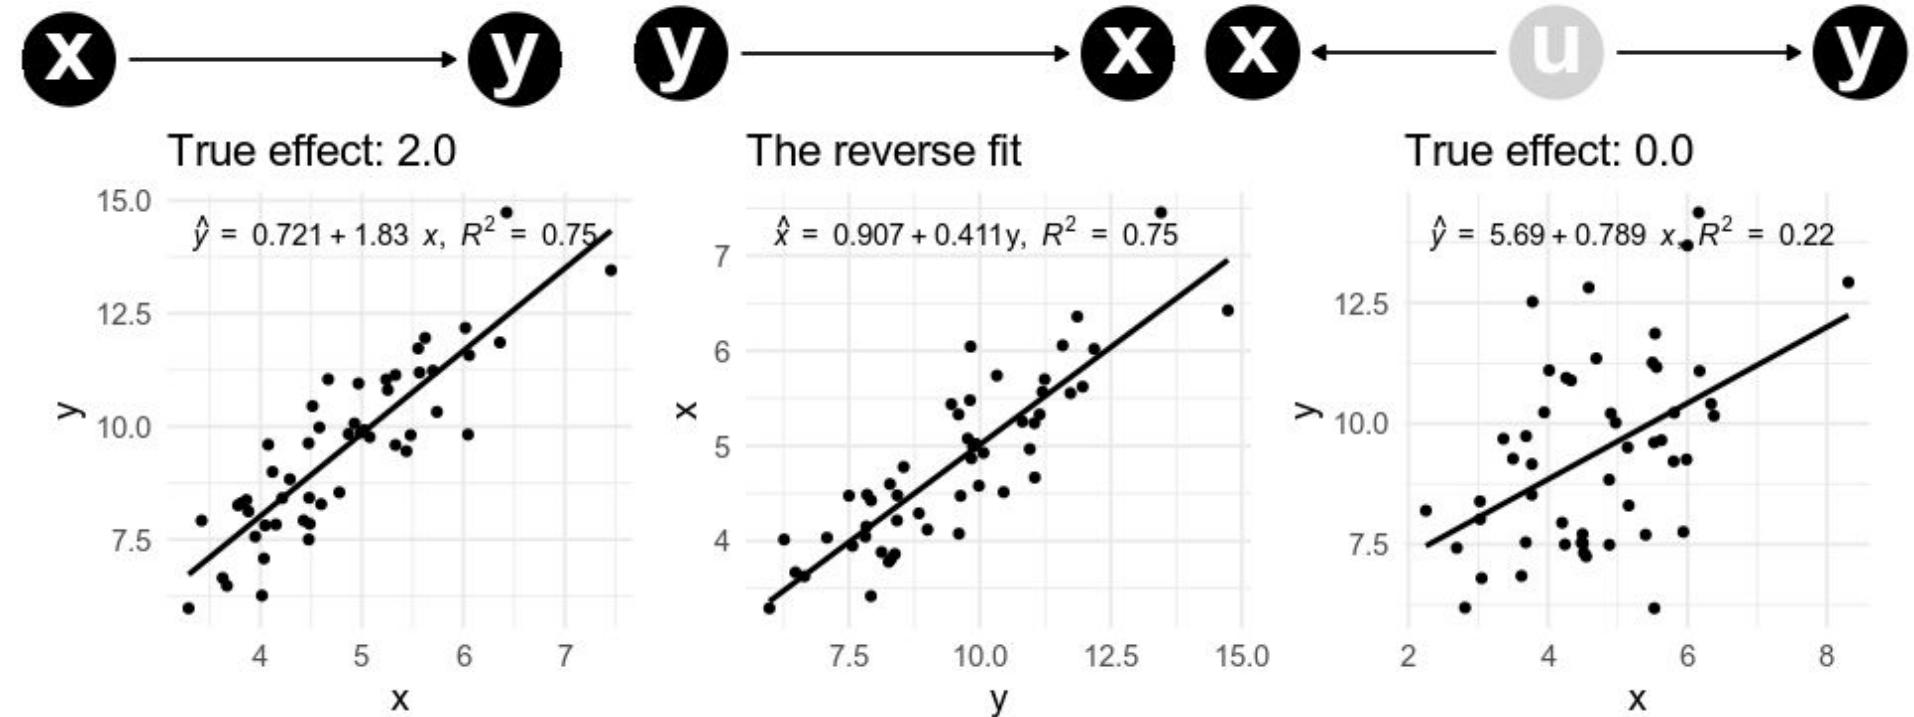

Statistical and
machine-learning models

Causal models

Correlation is caused by causation, confounding, coincidence, or conspiracy

Statistical models alone cannot derive causality from correlation

We learn causality by (1) listing models explicitly and (2) manipulating a variable and observe the outcomes

Model 1

Model 2

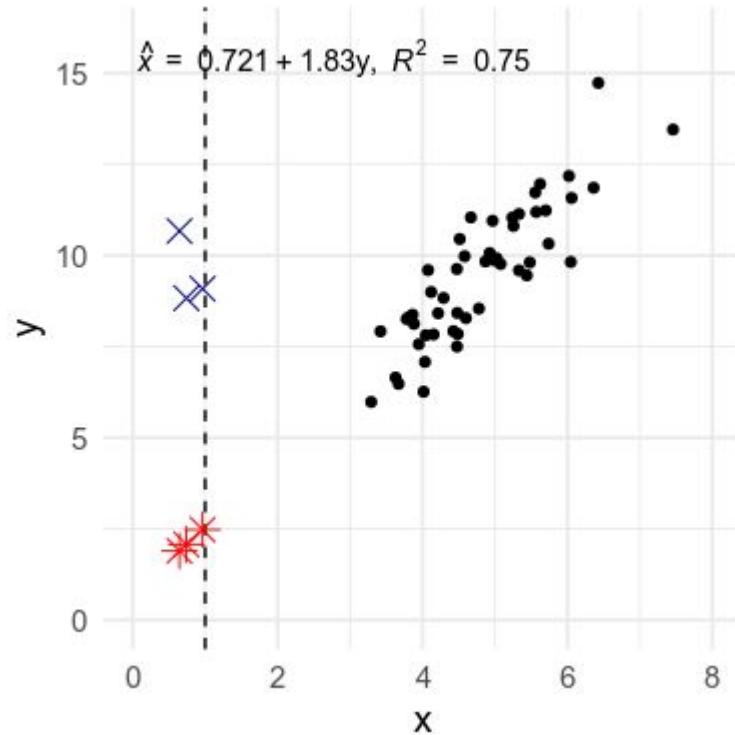

Model 3

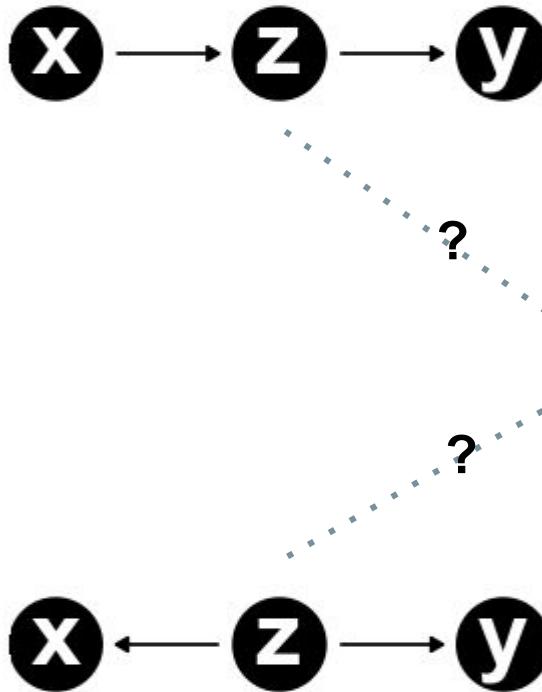

Assume that the data is generated by either Model 1, or Model 2, or Model 3. And assume that we can manipulate the value of X by setting it to 1.0 (the dash line).

Question: which outcomes (red stars or blue crosses) would support which models? Why?

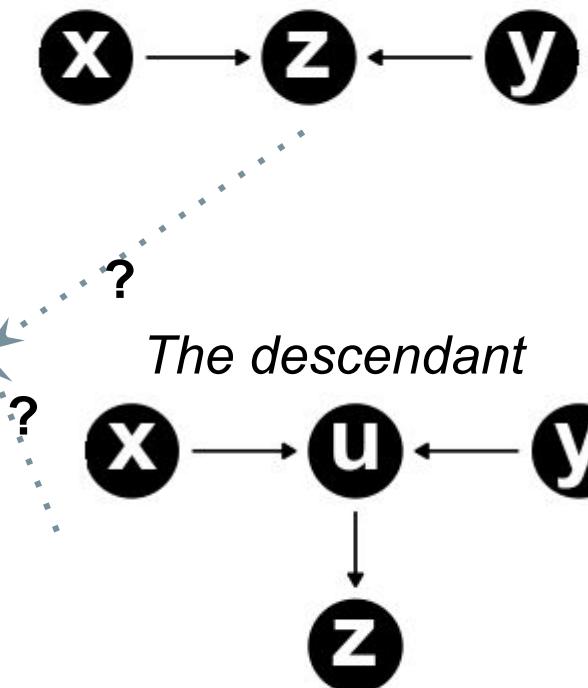

Causality is crucial for drug discovery

Biomarker, tox study, pathology,
omics data, real-world data, ...

	x	z	y

Tabular data, spreadsheets organized in rows and columns, are ubiquitous across scientific fields, from biomedicine to particle physics to economics and climate science^{1,2}. The fundamental prediction task of filling in missing values of a label column based on the rest of the columns is essential for various applications as diverse as biomedical risk models, drug discovery and materials science. Although deep learning has revolutionized learning from raw data and led to numerous high-profile success stories^{3–5}, gradient-boosted decision trees^{6–9} have dominated tabular data for the past 20 years. Here we present the Tabular Prior-data Fitted Network (TabPFN), a tabular foundation model that outperforms all previous methods on datasets with up to 10,000 samples by a wide margin, using substantially less training time. In 2.8 s, TabPFN outperforms an ensemble of the strongest baselines tuned for 4 h in a classification setting. As a generative transformer-based foundation model, this model also allows fine-tuning, data generation, density estimation and learning reusable embeddings. TabPFN is a learning algorithm that is itself learned across millions of synthetic datasets, demonstrating the power of this approach for algorithm development. By improving modelling abilities across diverse fields, TabPFN has the potential to accelerate scientific discovery and enhance important decision-making in various domains.

The screenshot shows the GitHub repository for TabPFN. The repository has 29 branches and 1 tag. The main branch is active. Recent commits include merging pull requests from Luke31, NoahHollmann, and others. The repository is public and owned by PriorLabs.ai. It includes tags for data-science, machine-learning, foundation-models, and tabPFN.

Source code at <https://github.com/PriorLabs/tapfn>, released in a license analogous to Apache 2.0 (commercial use friendly).

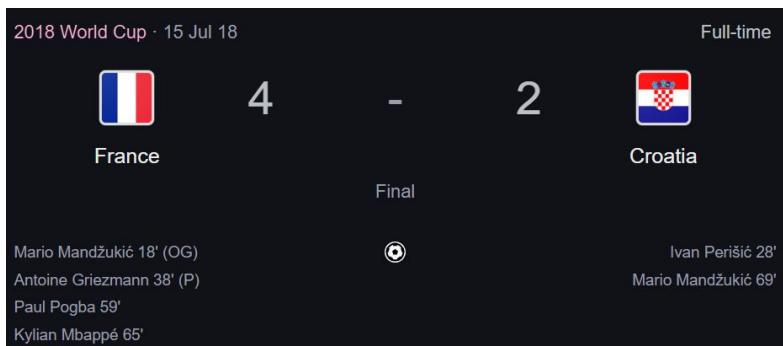

In-Context Learning (ICL)

The model isn't explicitly trained on a particular task ahead of time. Instead, the prompt itself provides examples that enable the model to perform the task on the fly. It is one of the intriguing abilities of deep transformer models.

Who won the final game of World Cup 2014?

Reasoned for a few seconds

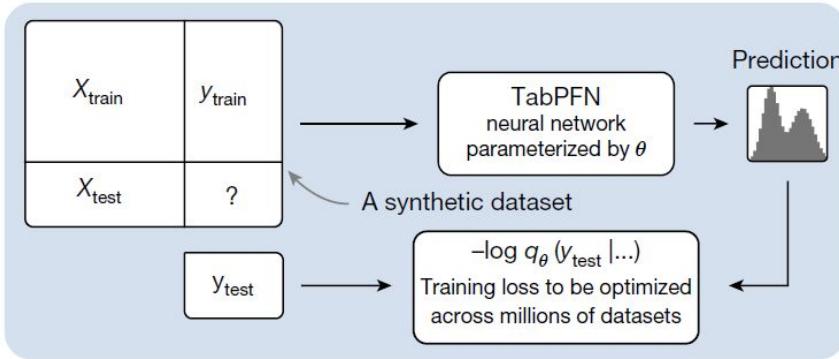

Germany won the final of the 2014 FIFA World Cup, defeating Argentina 1–0 in extra time.

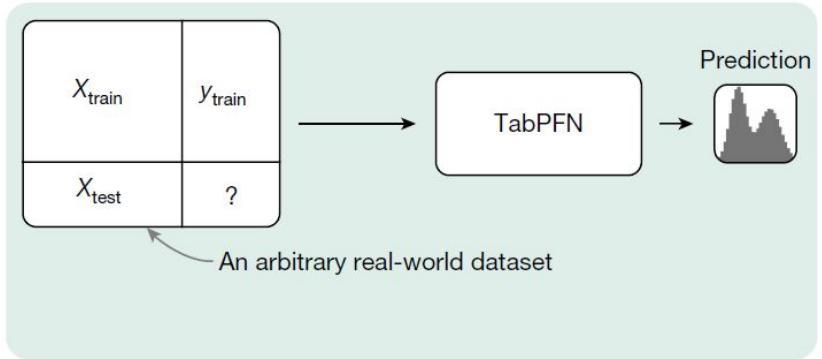

Left: chat history (ChatGPT o1 model, tested on 18.03.2025). Right: The ground truth.

Tabular Prior-data Fitted Network (TabPFN) is trained with synthesized data and predicts missing value in user data

TabPFN is trained on synthetic data to take entire datasets as inputs and predict in a forward pass

TabPFN can now be applied to arbitrary unseen real-world datasets

A metaphor: Imagine a lab where millions of billiard games are played simultaneously: in each game, different numbers of balls are placed randomly, and a white ball starts with a random velocity at a random position. By learning the trajectory of all balls of all games, one may learn to predict the trajectory of any real billiard game, as long as the positions of all balls and the initial velocity of the white ball is known.

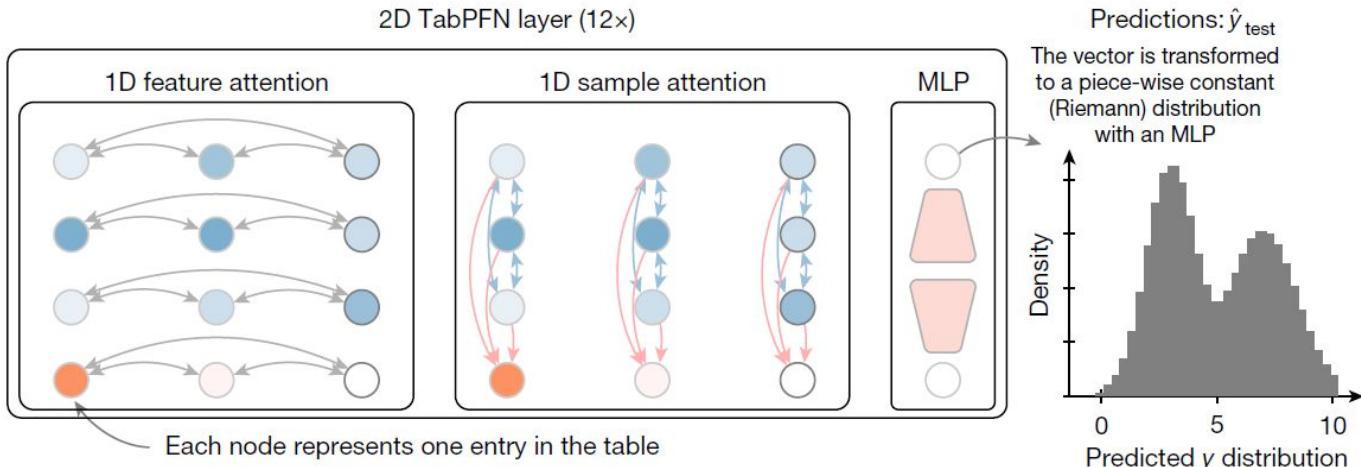

Architecture of TabPFN uses both row-wise sample and column-wise feature information to predict a distribution

We predict this entry

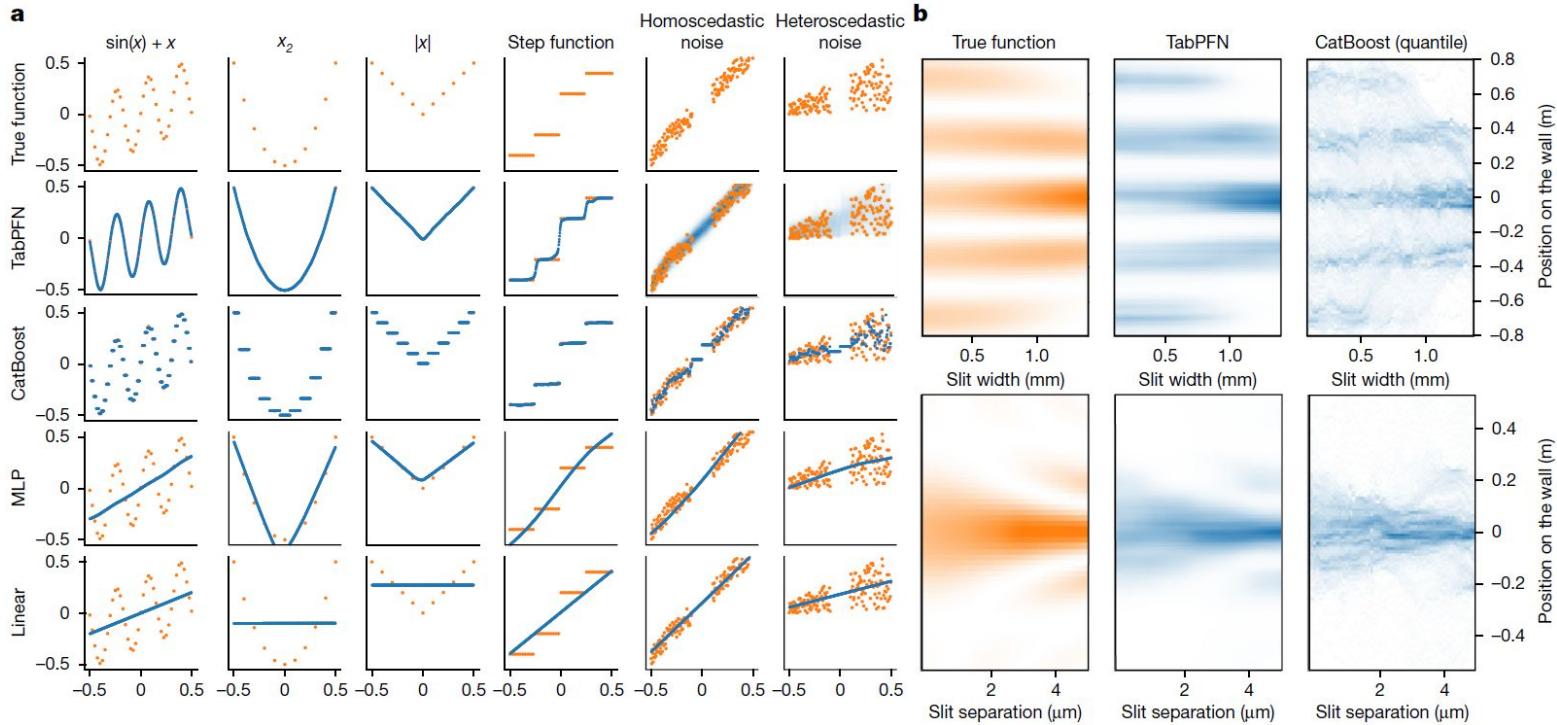

Generating synthesized data with causal models

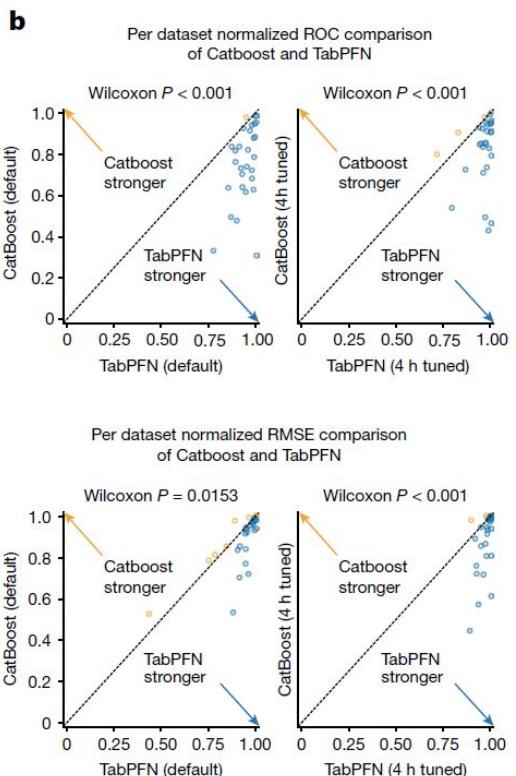

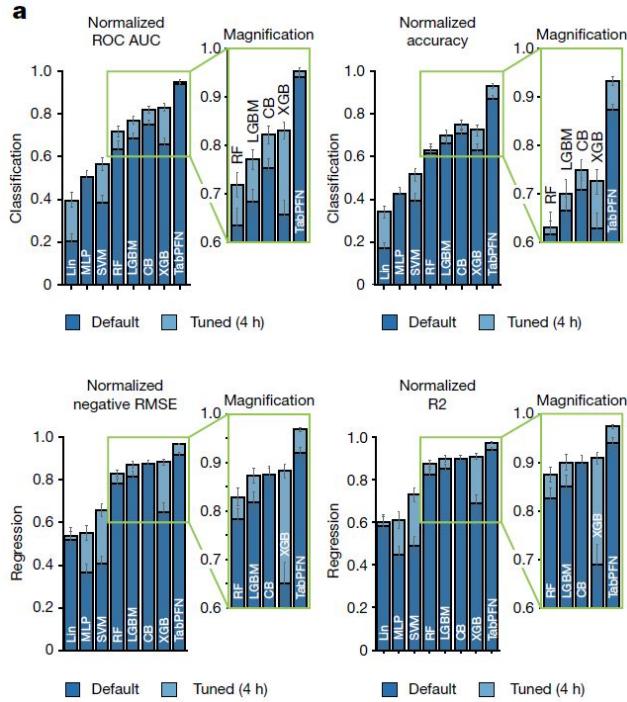

1. We sample 100-million structurally unique directed acyclic graphs (DAGs) as causal graphs that generate data.
2. Random data is assigned to the root node. Other nodes are propagated by rules specified by the edges, plus a Gaussian noise.
3. The values of sampled features (input to the model) and targets (output of the model) are extracted.
4. Data are post-processed (non-linear distortion, binning, random missing) to reflect real-world data processing.
5. Synthesized data from 10^8 causal experiments are used to train *TabPFN*.

Conclusions

- We predict efficacy and safety profiles of drugs by studying the mechanism and mode of action (MoA).
- The study of MoA involves building mechanistic, statistical, and causal models to predict what drug does to the body (pharmacodynamics) and what body does to the drug (pharmacokinetics).
- Bulk and single-cell RNA sequencing, and proteomics based on mass spectrometry (MS, in backup) are essential tools for understanding MoA.

Supplementary Information

Embryonic origins of tissues

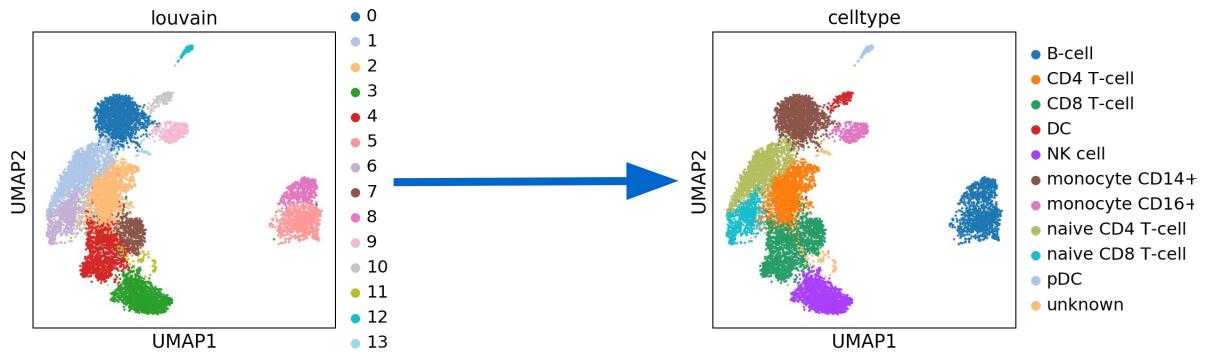

Germ Layer	Gives rise to:		
Ectoderm	Epidermis, glands on skin, some cranial bones, pituitary and adrenal medulla, the nervous system, the mouth between cheek and gums, the anus		
Mesoderm	Connective tissues proper, bone, cartilage, blood, endothelium of blood vessels, muscle, synovial membranes, serous membranes lining body cavities, kidneys, lining of gonads		
Endoderm	Lining of airways and digestive system except the mouth and distal part of digestive system (rectum and anal canal); glands (digestive glands, endocrine glands, adrenal cortex)		

An intern project: Cell type annotation

From unsupervised clustering and cluster based annotation

Luis Wyss
RAAN intern 2019

	Gene 1	Gene 2	Gene 3	Gene 4	Gene 5	Label
Training Cell 1	10	50	0	12	4	Celltype A
Training Cell 2	8	45	78	3	23	Celltype B
Training Cell 3	14	55	78	65	55	Celltype B
Training Cell 4	78	12	13	9	58	Celltype A
Training Cell 5	45	23	65	98	11	Celltype C

To supervised annotation at single-cell level:

	Gene 1	Gene 2	Gene 3	Gene 4	Gene 5
Cell 1	45	45	8	56	3
Cell 2	65	120	78	45	12
Cell 3	79	12	34	65	88
Cell 4	7	59	32	47	62

	Gene 1	Gene 2	Gene 3	Gene 4	Gene 5	Prediction
Cell 1	45	45	8	56	3	Celltype A
Cell 2	65	120	78	45	12	Celltype B
Cell 3	79	12	34	65	88	Celltype C
Cell 4	7	59	32	47	62	Celltype B

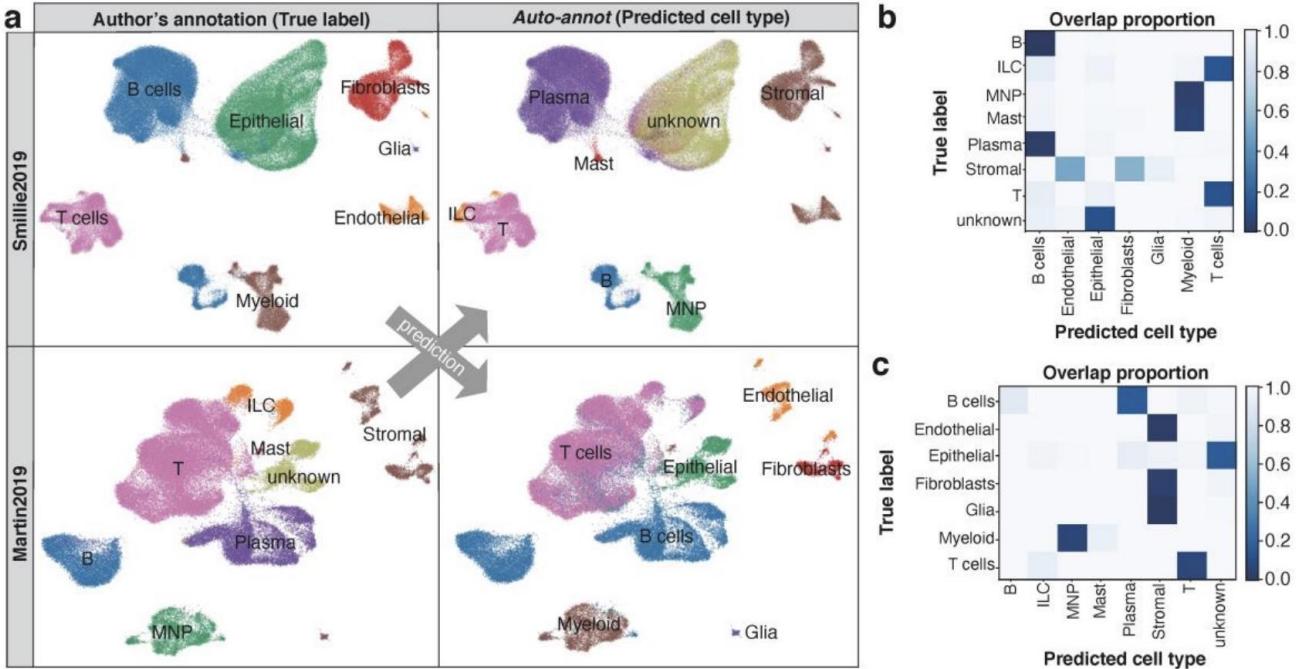

Advantages: (1) automation, (2) annotation independent from clustering, and (3) we can estimate the confidence of prediction

Abundance of immune cells in tumor microenvironments affect outcome

TLS: tertiary lymphoid structures; T_{reg}: regulatory T cells; M: macrophages; M1/M2: subtypes of macrophages

An example of Inflammatory Bowel Disease (IBD)

We observed Inconsistent cell type nomenclature across studies.
 Machine learning allows us compare and integrate multiple studies.

We are living ecosystems

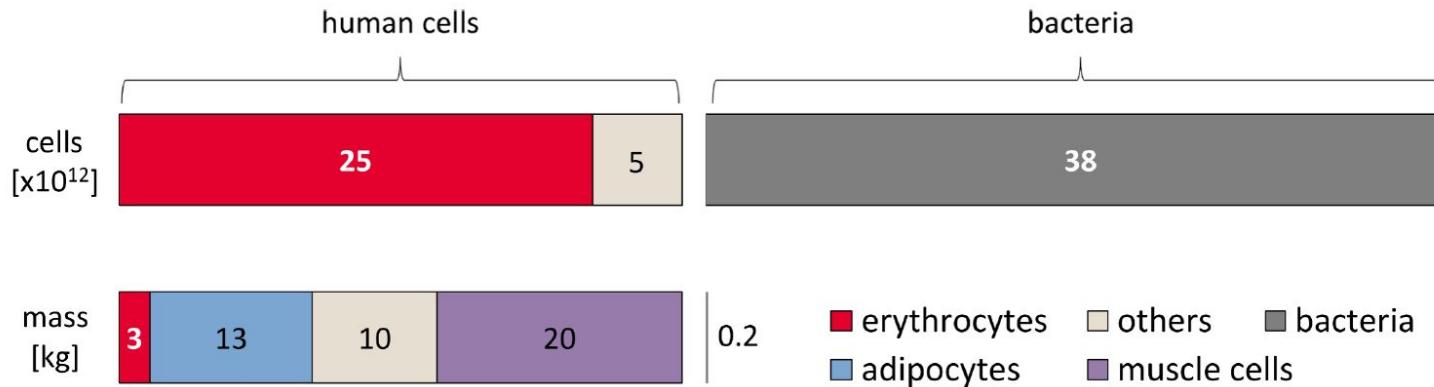

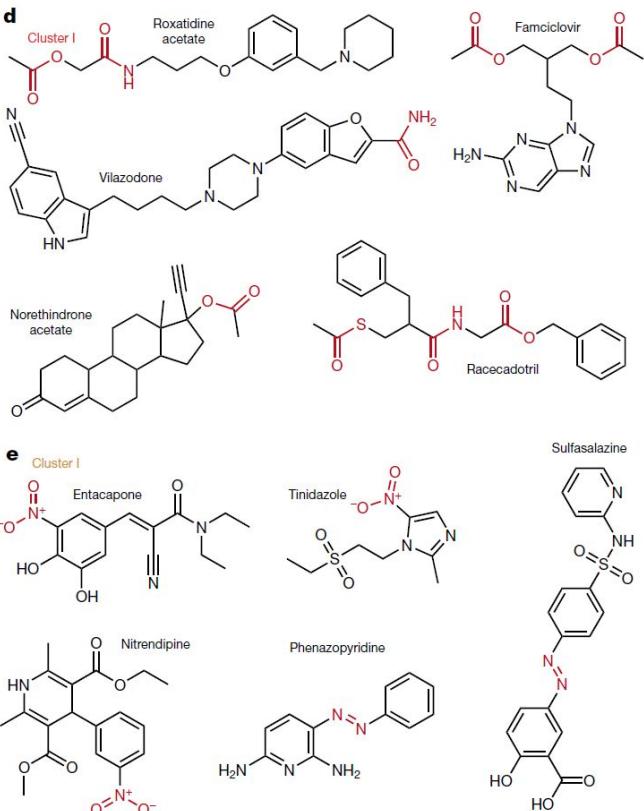

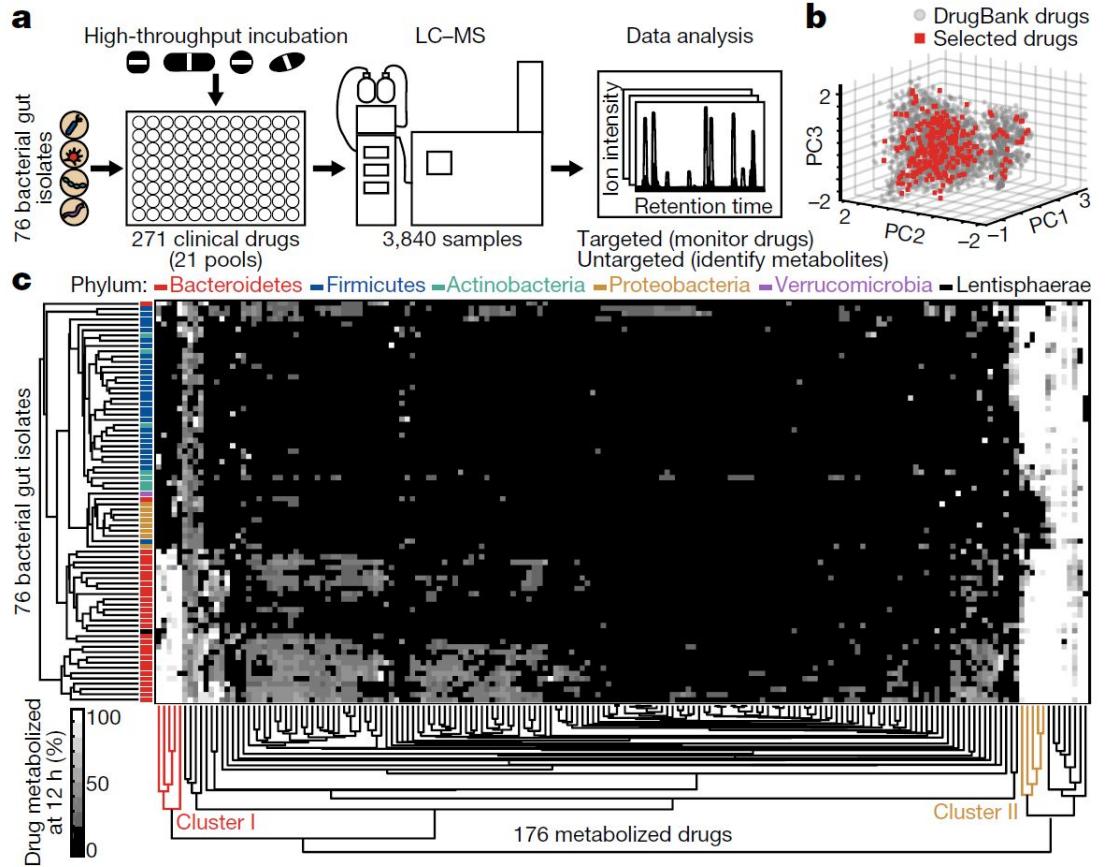

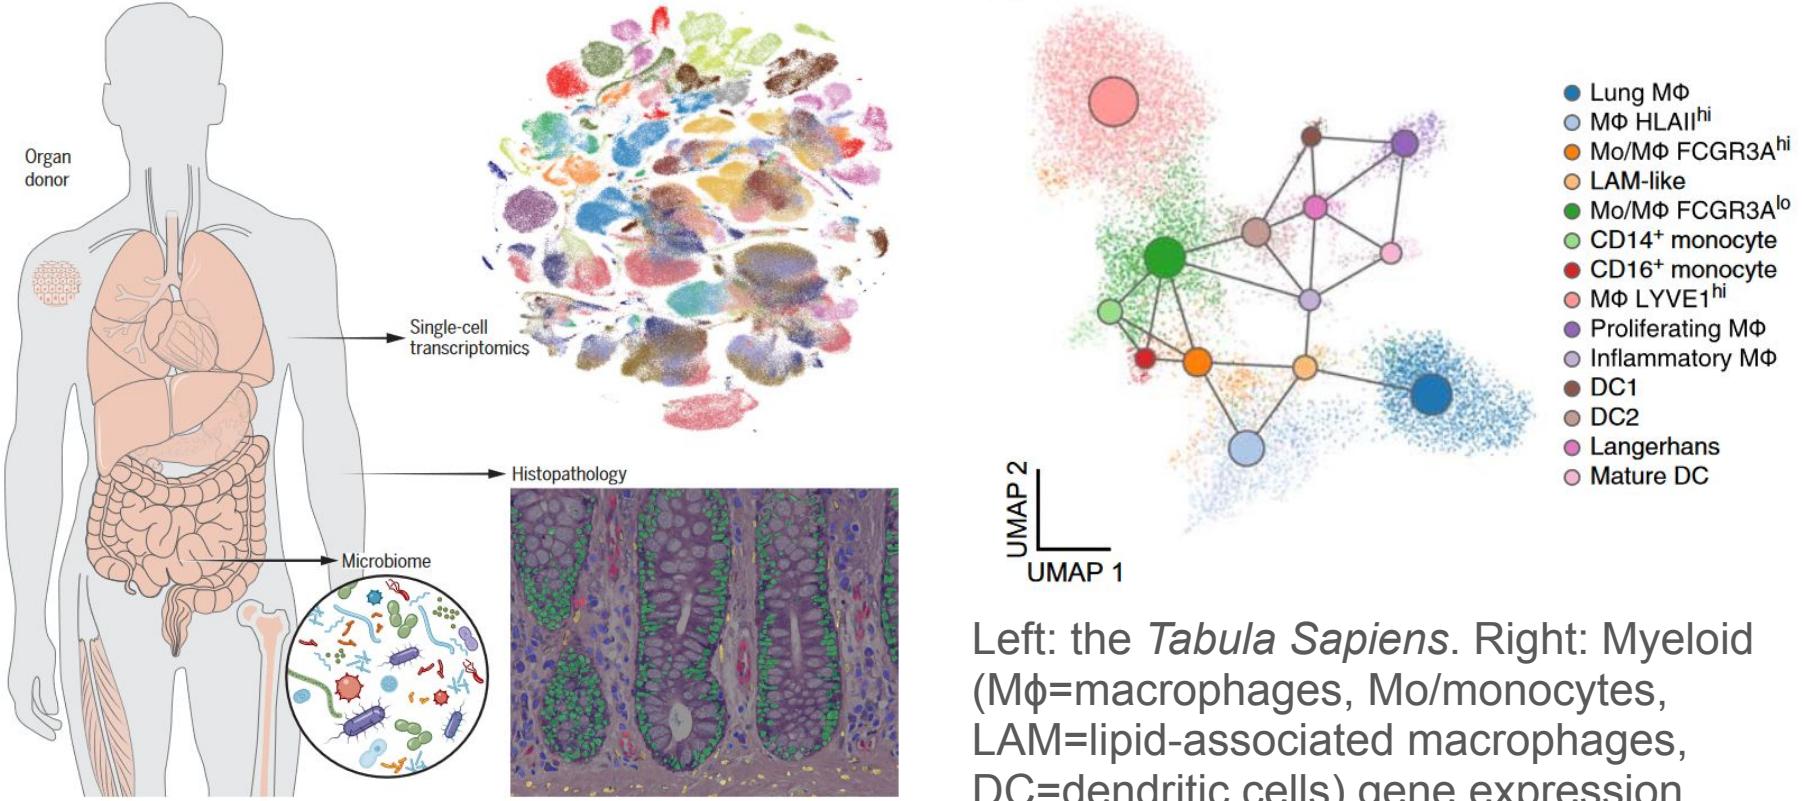

Table 3. B/H ratio for different population. See Table B in [S1 Appendix](#) for full references.

population segment	body weight [kg]	age [y]	blood volume [L]	RBC count $[10^{12}/L]$	colon content [g]	bac. conc. $[10^{11}/g \text{ wet}]^{(1)}$	total human cells $[10^{12}]^{(2)}$	total bacteria $[10^{12}]$	B:H
ref. man	70	20–30	4.9	5.0	420	0.92	30	38	1.3
ref. woman	63		3.9	4.5	480	0.92	21	44	2.2
young infant	4.4	4 weeks	0.4	3.8	48	0.92	1.9	4.4	2.3
infant	9.6	1	0.8	4.5	80	0.92	4	7	1.7
elder	70	66	3.8 ⁽³⁾	4.8	420	0.92	22	38	1.8
obese	140		6.7	5.0 ⁽⁴⁾	610 ⁽⁵⁾	0.92	40	56	1.4

Gut microbiome can metabolize drugs differently

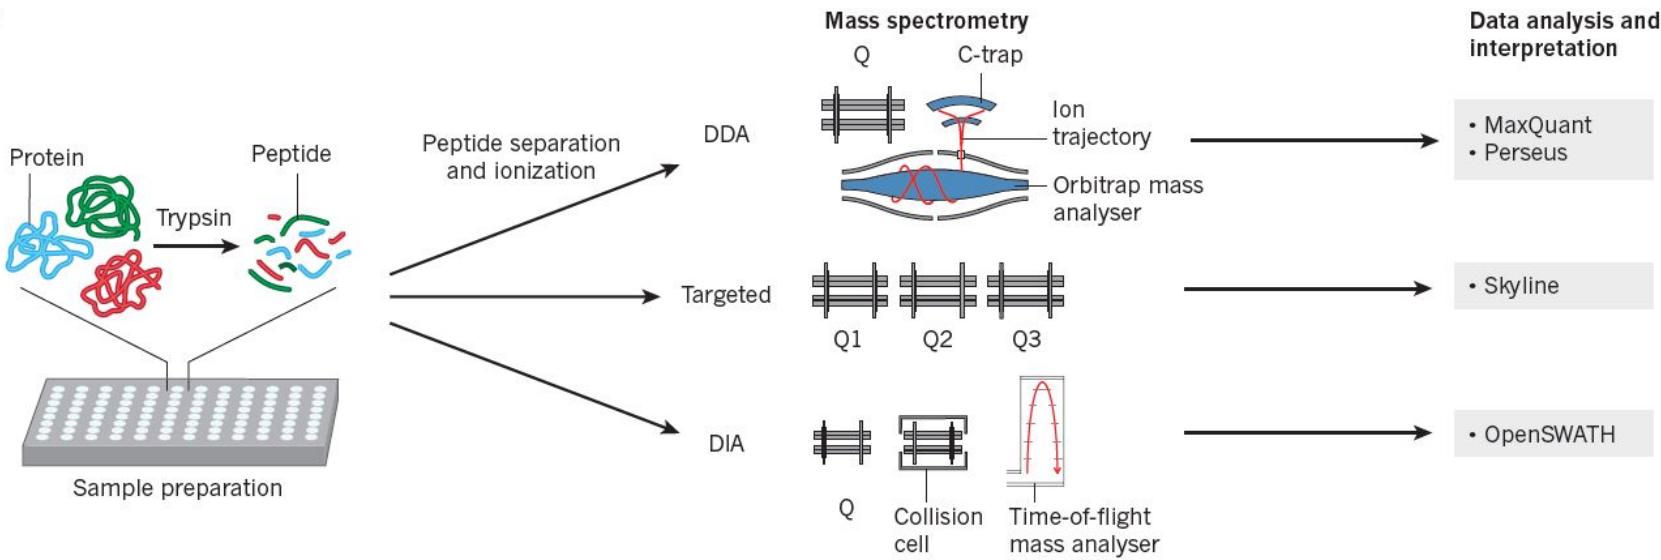

The *Tabula Sapiens* and other community projects offer reference expression data in healthy donors

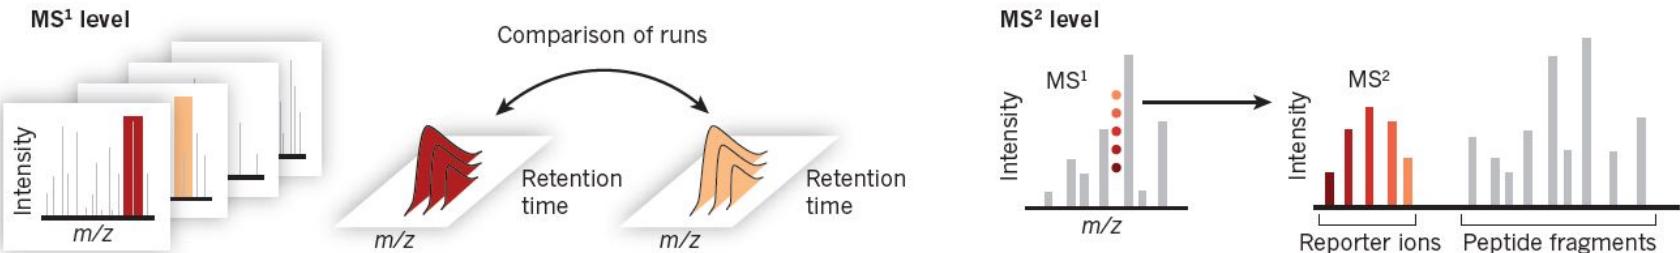

Left: the *Tabula Sapiens*. Right: Myeloid (MΦ=macrophages, Mo/monocytes, LAM=lipid-associated macrophages, DC=dendritic cells) gene expression

Mass-spectrometry based proteomics

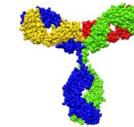

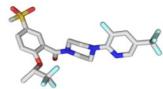

a

b Peptide quantification

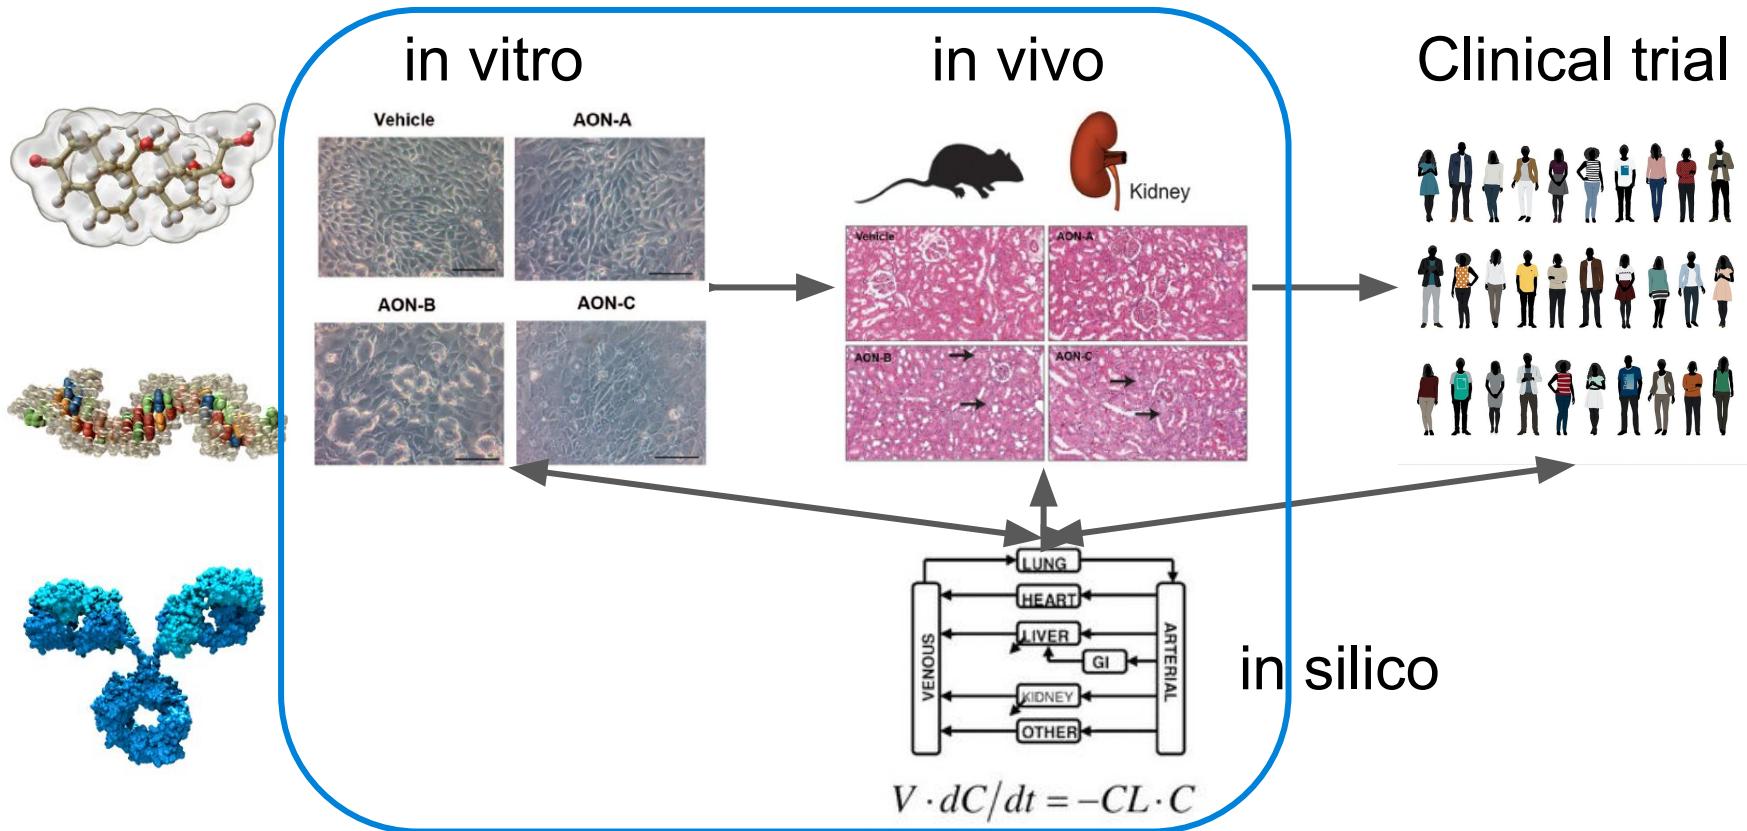

Comparing modalities with regard to safety assessment

	Small molecules	Single Stranded Oligos	Biologics
Molecular weight	<1000 D	5000-7000 D	> 30000 D
Manufacture	Chemical synthesis	Chemical synthesis	Biologically-derived
Structure	Single entity, high purity	Single entity with 10-15% product-related impurities	Complex, heterogeneous
Chemical-driven toxicity	Yes	Yes	No
Metabolism	Species-specific	Species-independent catabolism by proteolytic degradation	Species-independent catabolism by proteolytic degradation
PK	Generally short $t_{1/2}$	Long (tissue) $t_{1/2}$	Long $t_{1/2}$
Some general aspects	High throughput screening/early safety testing of up to 500 small molecules	Biodistribution with consistent patterns	Fewer, yet complex due to biology/immunology

Proteomics plays an important role in *in vitro/in vivo* translation

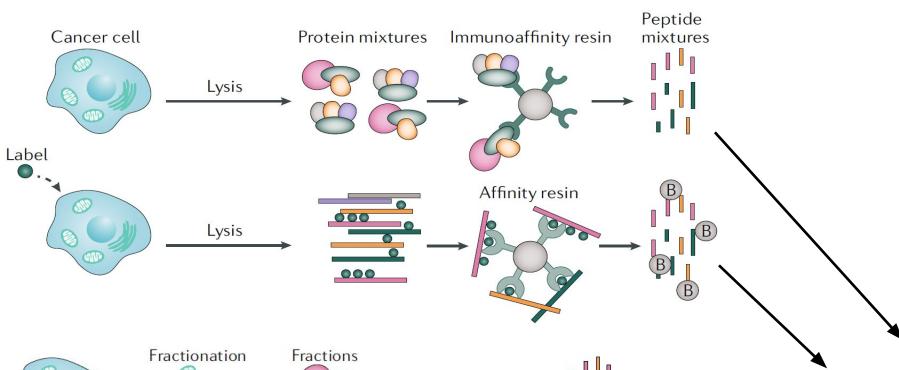

Mass-spectrometry based proteomics

- **SDS-PAGE:** Sodium Dodecyl Sulphate-Polyacrylamide Gel Electrophoresis
- **ESI:** Electrospray ionization
- **q1/q2:** selection/collision/separation cells
- **MS:** Mass spectrometry
- **MS/MS:** tandem mass spectrometry

Proteomics approaches for drug discovery

Affinity purification

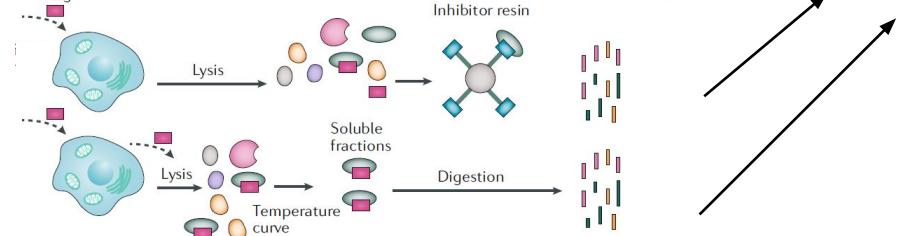

Proximity labelling

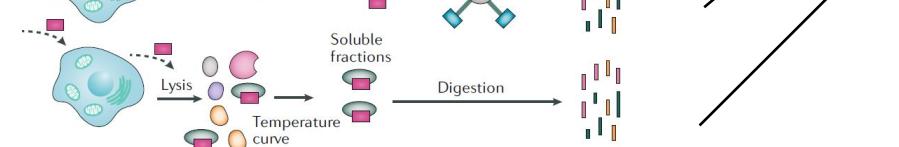

Organelle proteome profiling

Post-translational modification (PTM) profiling

Chemoaffinity enrichment

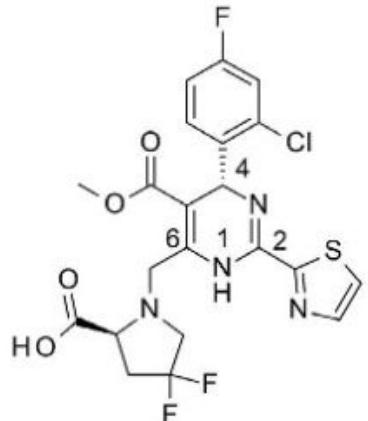

Thermal proteome profiling

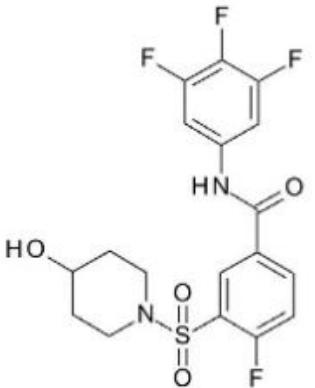

Case 1: Differentiate two compounds that inhibit Hepatitis B Virus with similar mode of action

a

HAP_R01

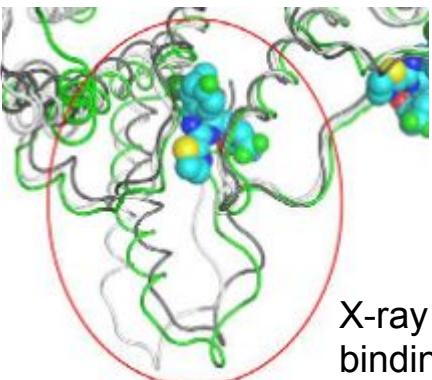

SBA_R01

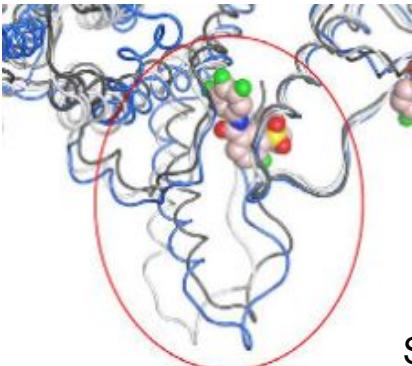

b

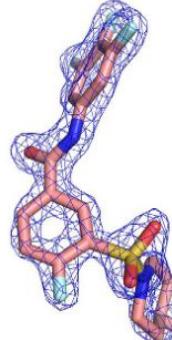

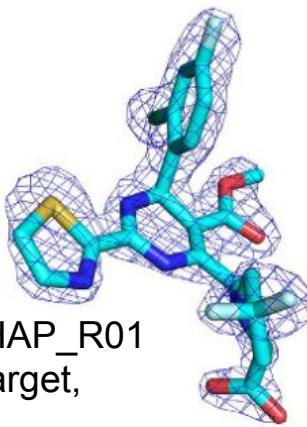

Compound	IC_{50} (μM)	EC_{50} (μM)	CC_{50} (μM)
HAP_R01	0.39 ± 0.13	0.0064 ± 0.0006	34.8 ± 1.8
SBA_R01	1.90 ± 0.22	0.26 ± 0.02	8.05 ± 0.92

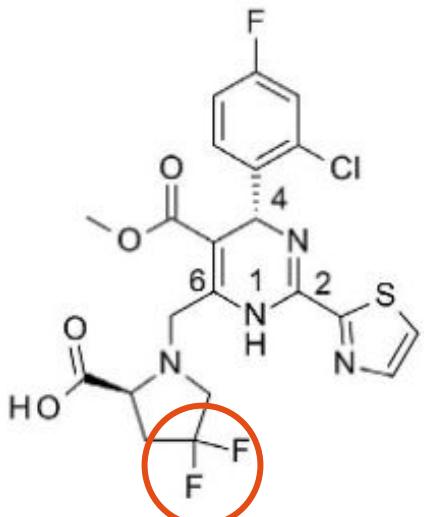

X-ray data of HAP_R01 binding to its target, HBV capsid

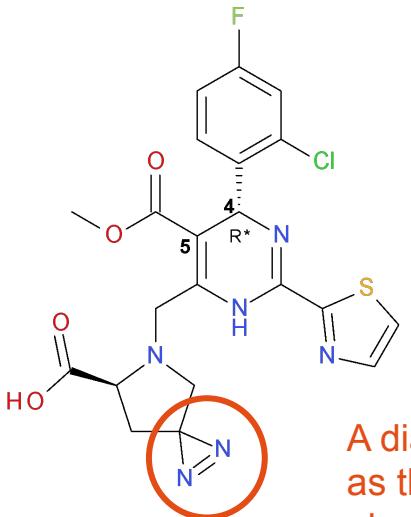

SBA_R01

Chemical probes: drug-like molecules to probe its mode of action

	IC_{50} (μM)
HAP_R01	0.39 ± 0.13

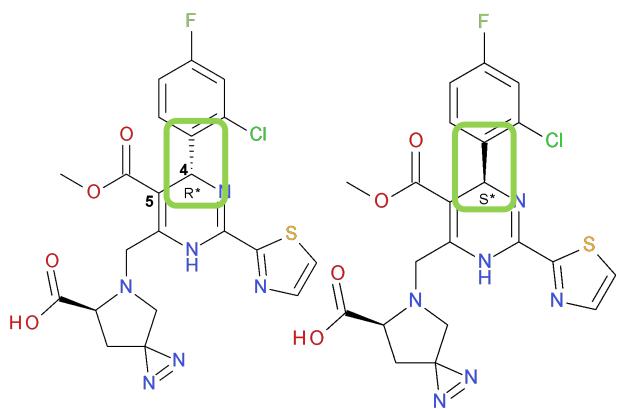

EC_{50} : **0.040 μM**
 IC_{50} : **0.47 μM**

A diazirine group
as the
photoreactive
group

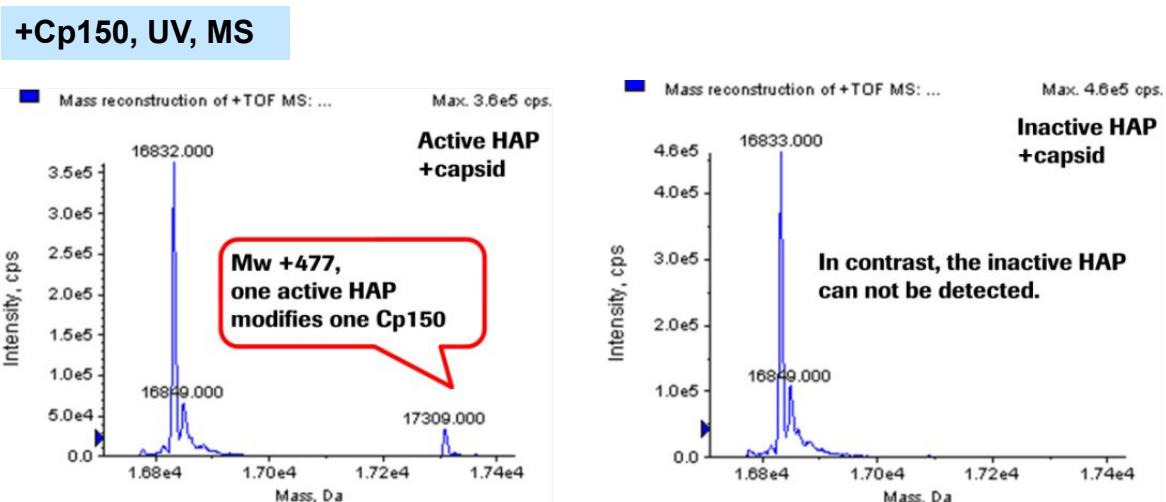

Case 1 solved: Proteomics confirmed target binding and mapped the small molecule binding pocket

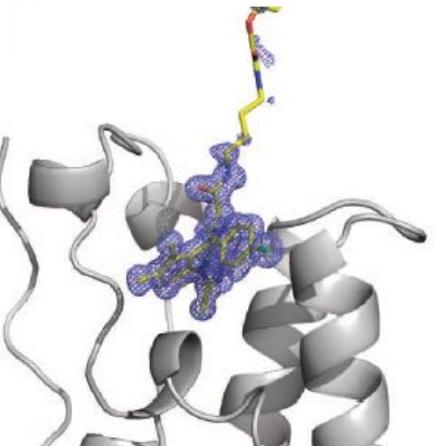

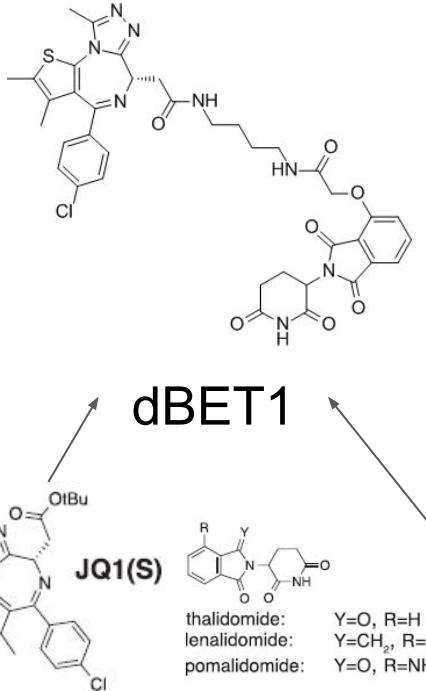

RO-A
 EC_{50} : 0.040 μM
 IC_{50} : 0.47 μM

RO-B
 EC_{50} : >1 μM
 IC_{50} : >100 μM

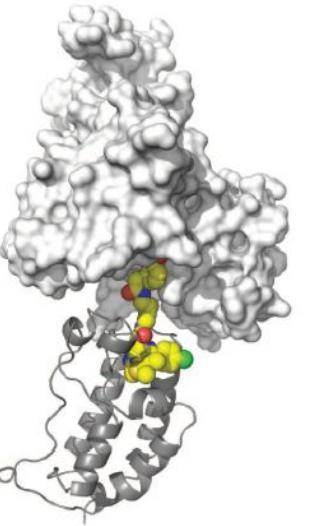

Proteolytic digestion/LC-MS/MS identified labelling site **Y118 (Y=Tyrosine)** of HBV capsid protein. More photoaffinity probes identified labelling sites at **R127 (R=Arginine)** and **Y38**.

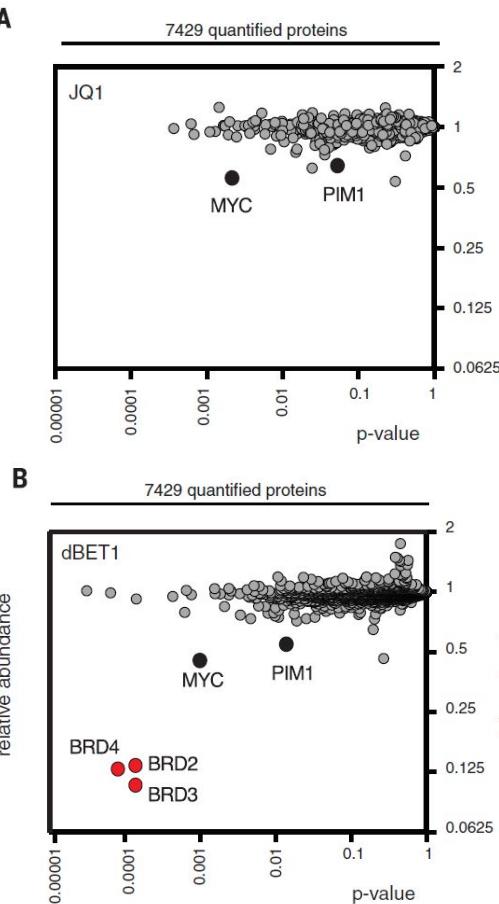

Case 2: Confirmation of selective degradation of protein target *in vivo*

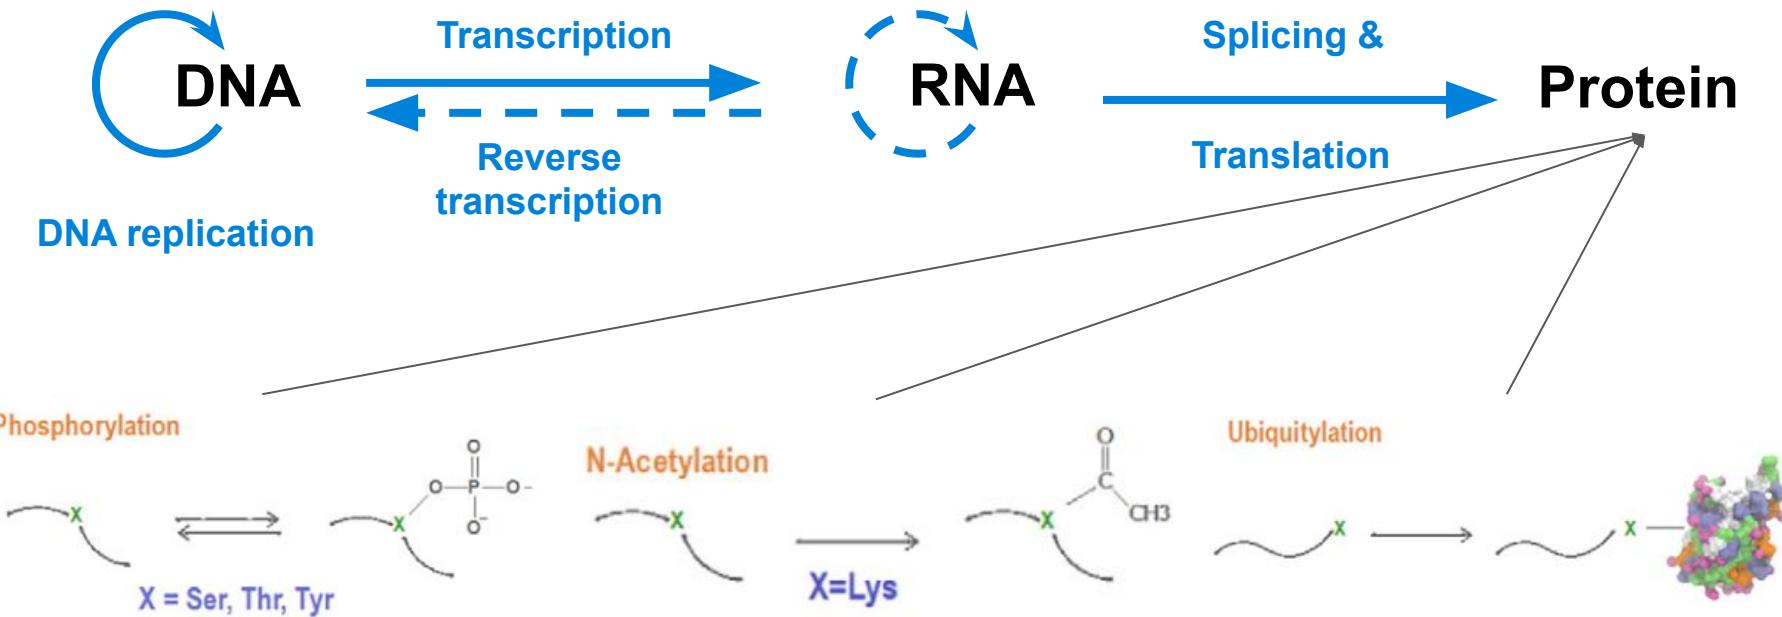

Crystal structure of dBET1 binding to its target BRD4

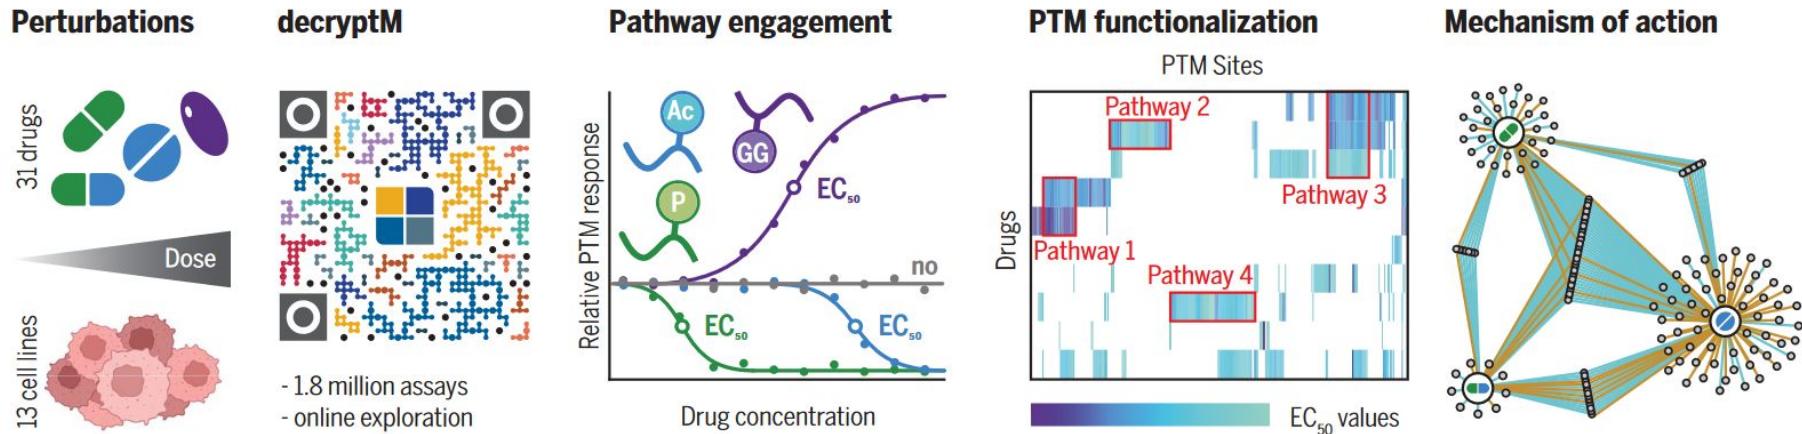

Docking of dBET1-BRD4 to DDB1-CRBN structure

Protein post-translational modifications (PTMs) offer an additional layer of regulation

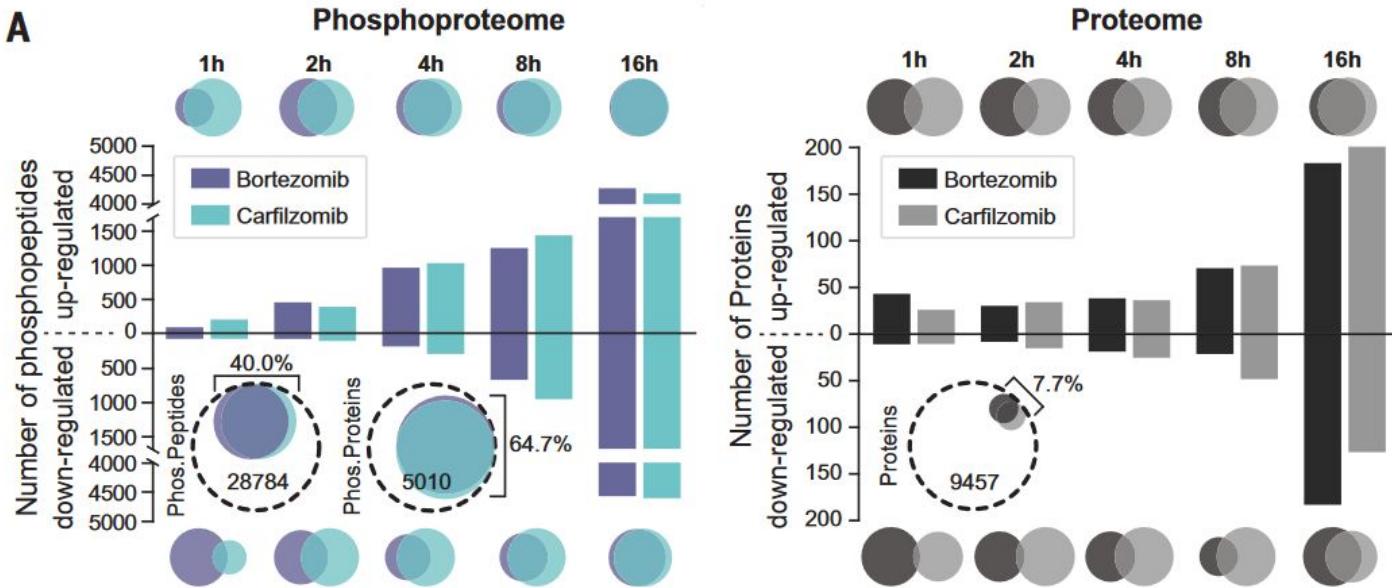

Case 3: Millions of PTM profiles induced by drugs in cancer cell lines

decryptM (Nature 2023): Following the dose-dependent treatment of cancer cells with drugs, quantitative mass spectrometry records dose-response of thousands of posttranslationally modified peptides. EC₅₀: half-maximal effective concentration; Ac, acetylation; GG, ubiquitinylation; P, phosphorylation.

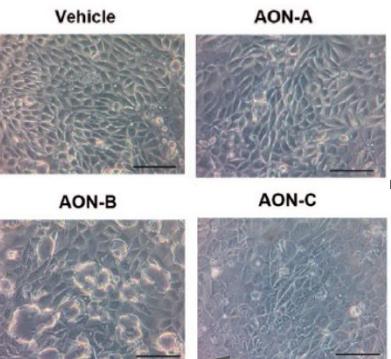

PTM and proteomics characterize MoA of drugs

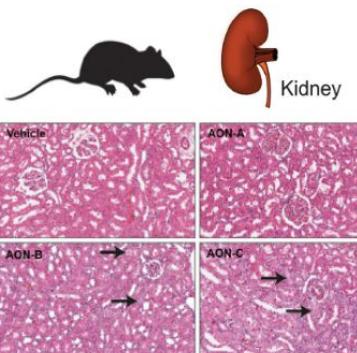

Bortezomib (BTZ) and carfilzomib (CFZ) both treat multiple myeloma by inhibiting the proteasome by reversible covalent (BTZ) or irreversible (CFZ) binding to the protease PSMB5. Time-series data show both the dynamics and the converging signaling.
